ABSTRACT
This bulletin describes 46 of the more comnon trees found in Minnesota's forests and windoreaks. The bulletin contains two tree keys, a sumer key and a yinter key, to help the reader identify these trees. Besides the two keys, the bulletin includes an introduction, instructions for key use, illustrations of leaf characteristics and twig characteristics, and a tree road map. Trees such as butternut, black walnut, bitternut hickory, honey locust, red maple, box elder, tamarack, black ash, green ash, balsan fir, and red pine are contained in the gnide. To further help identify these trees, and to act as a cross check of the key, illustrations of the leaf and twig, or needle group and cone, along with the key features of the species, are also included. Issued in furtherance of cooperative extension work in agriculture and home economics, acts of May 8 and June 30, 1914, in cooperation with the U.S. Department of Agriculture. Roland H. Abraham, Director of Agricultural Extension Service, University of Minnesota, St. Paul, Minnesota 55101.

## Minnesota's Forest Trees

## INTRODUCTION

The importance of Minnesota's forests is obvious when one realizes that the production and processing of wood and wood fiber is the third largest industry in our state. Tourism and recreation depend to a large extent on our forests. The retention of water and soil and the habitat for much of Minnesota's wildlife is directly dependent on forest cover. Windbreaks are planted and maintained to protect our farmsteads and croplands.

When the first settlers came to Minnesota, our state had about 31.5 million forested acres in a total land area of 51.2 million acres. With the development of agriculture and other land uses, forested lands now cover about 19.1 million acres. Tree planting is restoring some of our nonforested lands, and more trees - principally red (Norway) pine - were planted from 1955 to 1969 than in all former years combined.

The forest is a fundamental part of our environment and the ecological processes within the forest depend on the management of Minnesota's forest land. To learn of these processes, forest management techniques, and the forest environment, we must recognize the members of our forest community: the trees. shrubs, grasses, and other flora: the animals, birds, and other fauna.

## HOW TO USE THIS BULLETIN

This bulletin describes 46 of the more common teees found in Minnesota's forests and windbreaks. These may be identified by their specific characteristics through a process of elimination known as "keying out" a tree. A key is a series of steps toward identification.

Let's illustrate how a key is used by making a "people" key. Suppose you have six friends in your neighborhoor and you wish to use a key to describe them to your mother. You could use the following "people" characteristics.

1. Blond hair
2. Blue cyes

- Olaf

2. Brown eyes

- Fred

1. Brown hair
2. Bluc eyes
a. Big feet

- Pat
b. Small feet
- Ed

3. Brown eyes

| a. Fat | - Joe |
| :--- | :--- |
| b. Skinny | - Don |

You can explain to your mother that two of your friends, Olaf and Fred, have blond hair. You can further identify Olaf by his blue eye: and Fred by his brown eyes. Four cf your friends hav. brown hair. Pat and $\wp d$ have blue eyes, but Pat has big feet and Ed has small feet. Joe and Don have brown eyes, but Joc is fat and Don is skinn!.

A tree key works exactly the same except that we use leaves, fruit, flowers, bark, twigs, and other characteristics.

Trees are divided into two main categories: those which have cones (conifers) and leaves which are usually needlelike and green the whole year (evergreens); and those which lose leaves in the winter (deciduous) and have broadleaves (broad leaf).

The conifers are sometimes referred to as softwoods and the deciduous trews as tardwoods. These are confusing terms since the hardness of the vood is not really an identifying characteristic between the two categories. So let's simplify this by calling our two main groups CONIFERS and DECIDUOUS trees.

Ir, summer we can find more tree characteristics than in winter. but to identify trees the year round, let's use a SUMMER KEY and a WINTER KEY.

The place to study trees is in the forest or woodlot; take this bulletun along and look for the characteristics - bark, twigs, buds, leaves, and fruit.

Pay close attention to the bark. Color, texture, whether smooth or furrowed, scaly or firm, all are bark characteristics.

The twigs are interesting to study in the wintertime. They, too, vary in color: some are brittle, while others are tough and pliable: some are slender, while others are coarse. A taste of the :wig often helps to identify the tree, as for example, the cherries or yellow birch.

The buds go along with the twigs as part $c^{\prime}$ the winter study of the trees. It may be important to be able to recognize a forest seedling in the early spring before the leaves are out. This would be true if it were a valuable fores tree, such as a black walnut, and it was desired to cut around in to give it more light. In such instances, the buds are a helpitul means of identification.

Study the winter twigs carefull3. It is obvious that hickories, maples, and ashes have a terminal bud. But you must look closely when the basswood, elmis, and bircnes arc found. They may look as if they had a terminal bud, but on closer examination it is evident there is really a leaf scar on the end of the twig and the bud is a littie below and to one side. The color of buds indicates at once yhether the tree is a red, silver, or sugar maple.

As you study a:id compare leaves, look for the following points: Are they simple (one leaf to a stem) or compound? Are they arranged opposite on the twig or alternate? How is the margin of the ieaf shaped? This is most important. In some leaves, the nargin is entire (no breaks at all); in some, it is like the fine teeth of a carpenter's saw and is called serrate (saw-like); still others are doubly serrate; in others, the margin is more deeply rotched, as in the big-toothed aspen, and these we call toothed. Then come the oaks and some others in which the margin is very deeply cut. These leaves are described as lobed, and the hollows between are called clefts.

Trees have flowers, but usually the blooms are high up in treetops where you cannot easily see and identify them. Then, too, they are only present for a very brief season, so flowers are not used in the keys.

The fruit of the forest trees is an important item in forest appreciation, not so much as a means of identifying the tree, but as recognizing the seeds from which the different forest trees grow. Fruit does not necessarily mean fleshy, edible products, such as apples er cherries, but includes any seed and the covering in which it develops, whether cone, pod, samara (wingedsced), bur, or husk.

Learning to know the names of your "tree neighbors" is like. playing a detective game. With certain "clues," such as color of the bark, size and branching of the twig, shape of the bud, and form of the leaf, tree names can be "tracked down."

You will note that the common name of a tree is followed by a Latin or scientific name. All living things are so named because their common names may vary from state to state, and country to country, but the scientific name is always the same. It's the common name you want to remember. An example: Minnesota's state tree is called Norway pine in Minnesota, but red pine ill other parts of the country. But it has only one scientific name wherever it might grow - Pinus resinosa.

Here's an example of how the key works.
Look first at the "Summer Key to Minnesota's Trees" on page 6.

Notice that there are two item I's. The first, 1, says, "Leaves needle like, awl shaped, or scale like; usually evergreen." The second. 1, says, "Leaves broad, thick; not persistent over winter." Here you must make a choice. Suppose that the tree you are trying to identify is a rad pine. This will cause you to choose tie first, 1.

Then, you're ready for the second step. The next number in the key is 2 . Again, there are two, 2 's. The first 2 says, "Leaves needle like," the second 2 says, "Leaves awl shaped or scale like." The first 2 describes your tree's leaves.

You'll choose from the 3's next, "Needles borne in clusters," or "Needles borne singly, persistent year-round." Looking at your tree samples, you'll see that the first applies. Continue through all the numbers and you will have identified a red pine.

## SUMMER KEY TO MINNESOTA'S TREES

## CONIFERS (Evergreens. Softwoods)

1. Leaves needle like. awl shaped or scale like: usually evergreen.
2. L.eaves needle like.
3. Needles borne in clusters.
4. Cluster containing 2-5 needles (pines).
5. Needles in elusters of 2 .
6. Needles 4 to 6 inches long. snap cleanly when iolded.

Red pine
6. Needles 1 1/2 to 4 inches long. slighty to strongly twisted.
7. Needles widely spread. cones often remain closed.

Jack pine
7. Needles close logether. cones point to main stem.

Scotch pine
5. Needles in clusters of 2 or 3.5 to 11 inches long.
5. Needles in clusters of 5 . flexible. 3 to 5 inches long.

Ponderosa pire
Eastern white pine
4. Needles in clusters (more than 5) on short. spurlike branches. single leaves on new twigs. not persistent in winter.

Tamarack
3. Needles borne singly. persistent year-round.
8. Needles flattened in cross section.
9. Lower surface whitened, not constricted at base.
9. Lower surface whitened. but constricted at base. tips sometimes notched.

Balsam fir Eastern hemlock
8. Needles rectangular in cross section.
10. Needles yellow-green, twigs orangish.
10. Needles bluish-green.
11. Needles 1 to $11 / 3$ inches long, sharp tipped.
11. Needles $1 / 3$ to $3 / 4$ inch long, not as sharp.
12. Needles have "stinky" odor when crushed, trees the same; "cat" spruce, twigs hairless.

Norway spruce

Blue spruce
12. Needles blunt, twigs hairy. cones persistent.

White spruce
Black spruce
2. Leaves awl shaped or scale like.
13. Needles scale like and awl shaped: fruit a blueberry-like cole
13. Needles scale like, very aromatic; fruit a smali cone.

## Eastern redcedar <br> Northern white cedar

## DECIDLOUS (Broadleaves. Hardwoods)

1. Leaves broad. thin: not persis'ent over winter.

## 14. Leaves opposite.

15. Leaves siniple.
16. Leaves pale green on undersurface. clefts rounded. lobes sparsely toothed.
17. Leaves silvery white beneath. usually 5 -lobed. clefts deep.
18. 1.eaves whitish beneath. usually 3-lobed. clefts shallow and sharp angled.
19. Leaves compound.
20. Three to seven very variable leaflets. coarsely toothed.
21. Five to eleven symmetrical leaflets. finely loothed (Ashes).
22. Five to nine oval leaflets with stems. whitish below.
23. Seven to nine lanee-shaped leaflers with stems. light green below.
24. Seven to eleven oval leaflets without stems, whitish below.

## Sugar maple

Silver maple
Red maple

## Boxelder

White ash
Green ash
Black ash
14. Leaves alternate.
19. Leaves simple.
20. Leaves entire. not lobed or dceply cut.
21. Leaf margins serrate.
22. Leaves heart-shaped. serrations coarse.
22. Leaves linear, serrations fine; pinnately veined.
22. Leaves lanceolate to ovate.
23. Shiny. oblong, leathery leaves; twigs with bitter almond taste. 23. Dull. soft leaf with 3 basal veins: warty or corky bark.
22. Lea! rounded or triangular. pith star-shaped.
24. Leaf stem flattened. leaves triangular. leaf margin toothed.
24. Leaf stem flattened. leaves rounded. leaf margin serrate.
24. Leaf stem flattened. leaves rou. Jed. leaf margin toothed.
24. Leaf stem rounded. leaves egg-shaped. leai margin serrate with rounded teeth.
21. Leaf margins doubly serrate.
25. Base of leaves oblique (Elms).
26. Leaf upper surface very rough.
26. Leaf upper surface not as rough or smooth, twigs imooth.
26. Leaf upper surface smooth. twigs corky.
25. Base of leaves not oblique.
27. Twigs with faint wintergieen odor, trunk yellowish. papery bark.
27. Twigs without faint wintergreen odor.
28. Bark on trunk white papery, often grows in clumps.
28. Bark on trunk light gray-brown. thin scales. leaf very soft.
28. Bark on trunk thin. reddish-brown, usually short and thorny.

Basswood Willow

Black cherry Hackberry

Eastern cottonwood
Quaking asper
Bigtooth aspen
Balsam poplar

Slippery elm
American elin
Rock elm

Yellow birch
Paper birch
Ironwood
Wild plum
20. l.eaves lobed-not entire (Oaks).
19. L.eares compound.

> 29. Lobes with bristle tips (sharp points).
> 30. Lobes s:parated by rounded openings extending over halfway to midrib. bright red in early fall: acorn often striped and $1 / 2$ enclosed in cup.
> 30. Lobes separated is distance to midrib: dull green above. paler below, red in fall: large acorn in shallow cup.
> 29. Lobes rounded, not bristle tipped.
> 31. Lobes generally even in length; fruit in warty cep.
> 31. Lobes longer at outer tip. clublike: fruit in fringed cup.

Northern pin oak
Northern red oak

## White oak Bur oak

32. Leaves only once compound.
33. Five to nine finely twothed leaflets; pith of twigs solid.
34. Five elliptical leaffets. upper three much larger than lower two.
35. Five to nine lance-shaped leaves. no marked difference in size.
36. Eleven to 23 leaflets: pith of twig chambered. 35. Eleven to 19 leaflets. downy beneath. 35. Eleven to 23 leaflets. smooth beneath.
37. Leaves doubly compound.
38. Large leaflets. on thick twigs without spines, fruit a wide, thick-sinelled pod.
39. Very small leaflets. on slender iwigs with spines on twigs. branches, and trunk: fruit a long. twisted pod.

## WINTER KEY TO MINNESOTA'S TREES

1. Leaves persistent and green throughout the winter, needle shaped. awl shaped or scale like (see Summer Key-Conifers).
2. Leaves not remaining on trees throughout winter.

| 2. Twigs with small. wart-like branches. | Tamarack |
| :--- | :--- |
| 2. Twigs without small. wart-like branches. |  |
| 3. Buds and leaf-scars opposite each other on twigs |  |
| 4. Twigs slender. red to brown or green to purple: buds red or brown. |  |
| 5. Buds narrow. brown. sharp pointed. |  |
| 5. Buds broad. reddish. usually blunt pointed. |  |
| 6. Buds with silvery fuzz: twigs green to purple. | Sugar maple |
| 6. Buds smooth: twigs red to brown. |  |
| 7. Buds brown and pointed: twigs brown. | Boxelder |
| 7. Buds red and rounded; twigs red. | Silver maple |
| 4. Twigs stour. gray to orown: buds brown or black. |  |
| 8. Buds black: older bark grayish. scaly, rubs off easily. |  |
| 8. Buds dark brown: older bark furrowed or ridged. |  |
| 9. Twigs often fuzzy: leaf scar usually straight on upper edge. | Red maple |
| 9. Twigs smooth: leaf scar usually deep notched on upfer edge. | Black ash |

3. Buds and leaf scars alternate on t.igs.
4. Fruit a pod; persists on tree over winter.
5. Fruit a long twisted pod. thin skinned with many small black seeds.
6. Fruit a stout pod, thick skinned with three to six large brown seeds.
7. Fruit not a pod.
8. Pith of twig chambered.
9. Pith chocolate color: fuzzy "mustache" above leaf scar.
10. Pith light brown color: leaf scar deeply notched.
11. Pith of twig solid.
12. One or three oud scales covering bud.
13. One cup-like scale covering bud.
14. Three greenish to reddish bud scales.
15. More than five bud scales covering bue
16. Buds covered with dense - flow fuzz obscuring scales.
17. Bud scales plainly visible,
18. Bud scales loose and shaggy. grayish brown.
19. Bud scales tight and overlapping.
20. Lowest bud scale of side buds directly over leaf scar.
21. Buds are very sticky when squeezed.
22. Buds with very sweet aromatic odor.
23. Buds odorless.
24. Buds slightly sticky.
25. Buds appear varnished.
26. Buds covered with sparse white down.

Honeylocust Kentucky coffee tree

Butternut
Black walnut

## Black willow Basswood

## Bitternut hiciory

Shagbark hickory

Balsam poplar
Eastern cottonwood

## Quaking aspen

Bigtooth aspen
18. Lowest bud scale of side buds not centered over leaf scar.
22. Several buds clustered at tip of twig.
23. Buds pointed, light brown.

2i. No cork on twigs. older bark in long, flat ridges.
24. Older twigs corky, older bark in coarse, scaly ridges.

Northern red oak Bur oak
23. Buds not pointed. reddish brown.
25. Buds broadly oval. upper half woolly; twigs light red. Northern pin oak
25. Buds rounded: twigs greenish red to gray.
22. Only one bud at tip of twig.
26. Twigs with strong odor.

TREE IDENTIFICATION

Yellow birch
Black cherry
Wild plum

Paper birch
28. Older bark white and papery.
28. Older bark gray to brown in narrow ridges and fairly firm to spongy.
29. Buds sharp pointed. older twigs corky.
30. Lateral buds small and closely pressed to twig: twig slender and zigzag.
30. Lateral buds larger and not appressed: twig medium and not zigzag.
29. Buds dull-pointed, twigs corkless.
31. Buds and twigs brown. with soft hair.
31. Buds blackish. twigs gray. with bristly hair.
28. Older bark gray. shreddy and loose: a small tree.
27. Crushed twig with pleasant wintergreen odor.
27. Crushed twig with unpleasan: bitter-almond odor: no spines on trunk.
27. Crushed twig with unpleasant almond taste. trunk armed with spines.
ex

Hackberry

Rock elin

American elm
Slippery clm
Ironwood

RED PINE
(Norway pine)

Key Features: Two long, dark-green needles that break cleanly whea folded in two; scaly to platy reddish bark. 12

EASTERN WHITE PINE
Pinus strobus
Key Features: Five slender flexible needles per cluster, long light-brown cones, dark-brown blk y bark on old trees.

Key Features: Orange-brown bark; cones point to main stem; two short needles twisted and close together. Stem and trink often twisted.

JACK PINE
Pinus banksiana
Key Features: Closed, persistent cones that point to the end of the branch, bundles of two widely spreading needles, dark scaly bark.

PONDEROSA PINE
Pinus ponderosa
(Western yellow pine)
Key Features: Long needles, two or three in each bundle (the only pine in Minnesota with three). Needles don't break evenly as with Red pine. Cone 3 to 6 inches long, shaped like a top, armed with small spines. An introciaced tree, common in western Minnesota windbreak plantings.

13

## WHITE SPPUCE

Picea glauca
Key Features: Pungent odor to crushed needles, often called "cat" or "stinking" spruce. 2-inch shiny brown cones, hairless twigs. Generally found on upland sites.

## NORWAY SPRUCE

Picea abies
Key Features: Drooping branchlets on mature tree, orange twigs, large, light brown cones. Introduced from Europe as an ornamental and windbreak tree.

## BLACK SPRUCE

Picea mariana
Key Features: Dark, hairy twigs, short blue-green needles, small, persistent cones. Commonly found in moist locations.

BLUE SPRUCE
Picea pungens
(Colorado blue spruce)
Key Features: Needles $1-11 / 2$ inches long, sharp tipped, often bluish-green to silvery blue. Cones 2-3 inches long, cone scale margins wavier than other spruce. An introduced tree commonly found as an ornamental and in windbreaks.

## BAISAM FIR

Abies balsamea
Key Features: Spire-shaped tree with blisters on bark. Older branches dotted with flat circular needle scars. Cone usually erect and breaks up readily. Found in moist soils.

EASTERN HEMLOCK
Tsuga canadensis
Key Features: Row of needles lying on top of twig; tip of tree bends away from wind; small brown cones. Very few in the state.

NORTHERN WHITE CEDAR
(Arborvitae)
Key Features: Scale-like leaves "braided' 'in pairs at right angles to adjoining pairs, lustrous yellow-green and aromatic foliage in flattened fan-like sprays.

EASTERN REDCEDAR
Juniperus virginiana
Key Features: Columnar form, two types of leaves, reddish shreddy bark. Cone is a bluish berry.

Larix laricina
TAMARACK
Key Features: Clusters of needles on short shoots, deciduous needles turn gold and fall in autumn, small upright cones. Found in Minnesota lowlands and bogs.

WHITE ASH
Key Features: Usually seven oval leaflets with whitish lower surface; tight crisscrossed bark; "paddle-shaped" fruit.

GREEN ASH
Fraxinus pennsylvanica
Key Features: Seven to 19 lance-shaped, shiny green leaflets; tight, flaky crisscrossed bark; narrow "oar-shaped" fruit.

## HONEYLOCUST

Gleditsia triacanthos
Key Features: Leaves are doubly compound (rarely singly compound) with main leaf stem branched and 15 to 30 leaflets on each branch. Fruit is a reddish-brown twisted flat pod up to 18 inches long and 1-2 inches wide. Strong straight sharp spines on branches (there are cultivated varieties without spines).

KENTUCKY COFFEETREE
Gymnocladv:3 dioicas
Key Features: Leaves large, doubly compound on thick twigs, mottled in color. Fruit is a wide, thick-shelled pod wath 2 or more dark, bony seeds. Gld bark is in plates with sharp edges. No thoms.
 strips; aromatic flexible twigs, oval double-toothed leaves.

17

SUGAR MAPLE
Acer saccharum
(hard maple)
Key Features: Five-lobed, dark green leaves, dark brown twigs with pointed lorown buds, variable dark gray bark. strips.

SILVER MAPLE
Acer saccharinum (soft maple)
Key Features: Leaves are silvery-white beneath, clefts between lobes are deep, margin is more toothed, deeper lobed than sugar maple. Fruit is $1-2^{1 / 2}$ inches long, winged pair spreading far apart.

## RED MAPLE

Acer rubrum
Key Features: Three-lobed leaves that are whitish below, dark red twigs and buds, smooth gray bark that breaks up into fla'sy

## BOXELDER

Acer negundo
Key Features: Irregularly toothed compound leaves, stout whitish twigs, clusters of brownish-winged fruit.

AMERICAN BASSWOOD
Tilia americana
Key Features: Large, coarsely toothed, heart-shaped leaf; reddish zigzag twigs with large mucilaginous buds; light brown nutlets hanging from yellow strap.

BLACK CHERRY
Prunus serotina
Key Features: Finely toothed dark green leaves with red fuzz on lower midrib; silvery bitter tasting twigs; black platy scaled bark with upturned edges.

BLACK WILLOW
Salix nigra
Key Features: Slender reddish-brown twigs with small buds; shiny dark green leaves with hooked tip; dark, ridged-to-platy bark. There are many types of willow in Minnesota. Most have the very slender leaves.

HACKBERRY
Celtis occidentalis
Key Features: Bark is warty, ridgy, cork-like with many thin layers. Fruit is a small, gray hard berry. Many trees have clumps of small distorted twigs in their tops called "witches' brooms."

EASTERN COTTONWOOD
Populus deltoides
Key Features: Glossy, green triangular leaf; massive trunk with deeply furrowed gray bark; coarse twigs with sticky, odorless buds.

QUAKING ASPEN
Populus tremuloides (trembling aspen, popple)
Key Features: Trerioling, circular leaves, light greenish-white bark, slender bitter twigs.

BIGTOOTH ASPEN
(popple)
Key Features: Oval, coarsely toothed leaves; smooth greenish bark when young; buds covered with short, white hair.

BALSAM POPLAR
Populus balsamifera (balm of Gilead)
Key Features: Very conspicuors silver or gold lower leaf surface; sticky, aromatic buds; deeply furrowed gray bark.

## SLIPPERY ELM

Ulmus rubra
Key Features: Dark green, very rough leaves; gray twigs with very dark brown buds; loose, reddish-brown bark. Bark not in alternate layers of brown and white.

## ROCK ELM

Ulmus thomasii
Key Features: Thick, glossy green, toothed leaf; corky twigs with sharp buds; narrow, "shaggy" crown. Bark in alternate layers of brown and white.

AMERICAN ELM
Ulmus americana
Key Features: Oval, coarsely toorhed leaves, slender brown twigs and buds, large spreading "feather duster" crown. Bark in alternate layers of brown and white. Fruit margin is ciliate.

## IRONWOOD

Ostrya virginiana (Eastern hophornbcam)
Key Features: A small tree usually fourd growing under other hardwoods. Leaves are very soft to touch. Bark is "shreddy" in thin, narrow, loose ridges. Fruit is a loosely formed green pod resembling that of a hop vine.

NORTHERN RED OAK
Quercus rubra
Key Features: Leaver with seven to 11 bristle-tipped lobes; large shallow-cupped acorns; bark ridged with light gray inverted "ski tracks."

WHITE OAK
Key Features: Leaves with five to nine rounded lobes; gray, flaky bark with large smooth patches; shallow, warty cup at base of nut.

BUR OAK
Quercus macrocarpa
Kcy Features: Large leaves with decply indented central lobes; corky twigs, large fringed acorns.

NORTHERN PIN OAK
Key Features: Dark greer variable leaves; rough, blocky, black bark; acorn cup covered with loose, dull brown scales.

BUTTERNUT
Juglans cinerea
Key Features: Compound downy leaves; stout twigs with "mustache," light gray, flat-ridged bark. Twigs with chocolate colored pith.

## BITTERNUT HICKORY

Carya cordiformis
Key Features: Long sulfur-yellow büds; seven to nine bright green, lance-shaped leaflets; gray, smooth, slightly ridged bark.

## BLACK WALNUT

Juglans nigra
Key Features: Compound, smooth leaves; stout twigs with buff, chambered pith; dark sharply ridged bark.

SHAGBARK HICKORY
Carya ovata
Key Features: Compound leaf of five leaflets, the upper three much larger; shaggy, budded twigs; coarse, shaggy bark.

WILD PLUM
(American plum)
Key Features: Shrub or small tree, white flowers in spring, darkgreen leaves and red and yellow fruit. Bark thin, reddish brown, broken into thin plates. Trunk usually short and thorny.

## PROJECTS

## Mounting Tree Leaves

After pressing, leaves should he mounted on cardboard and labeled to show their common names, their scientific names, where they were found, and the date collected. Be careful when
mounting the leaves. Make your arrangements neat and attractive.

## Leaf Prints

Leaf printing is a good method of making a permanent collection of leaves. All that is needed is a stamp pad, (the larger the better), white paper (typewriter paper is fine), newspapers, and your leaves. Press the leaves for an hour between newspapers. This will flatten them and make them casier to print. Then place the leaf under-surface down, on the stamp pad: Cover the leaf with one thickness of newspaper and rub it firmly to get ink on the margin, the stem, and the veins. If the leaf is larger than the stamp pad you will have to move the leaf
around to get ink over the entire under-surface. Place the inked leaf on your paper. Cover the leaf with one thickness of clean newspaper and rub thoroughly. Be sure to rub all the leaf and do not let it slip or you will spoil the print. Remove the leaf from your paper and there is your print. Label these pages neatly and bind them into a nature notebook. Girls carrying this project might be interested in using leaves with textile paints to make designs on material.

1. Collect durit, ${ }^{g}$ the summer. identify and mount according to instructions, leaves from 25 different kinds of Minnesota trees.
2. Collect during the year, fruits such as cones, nuts, and acorns from 10 differert trees. Iden:ify these fruits, label them, and make a case in which they may be attractively displayed.
3. Select a large tree near your home or school that you can study and keep records on during the year.
4. Exhibit your leaf collection, fruit collection, project report, and record of activities at your club or community exhibit or fair in a scrapbook or display box.
5. During the winter collect, identify, and mount twigs from 12 Minnesota trees. Exhibit these with your leaf collection.
6. Make an educational exhibit on some phase of forestry and display it in a local store window or at a county fair or community exhibit. Exhibits enccuraging forest fire prevention, tree planting, or forest managenent are recommended.
7. Make a collection of 15 leaf prints of Minnesota trees and shrubs. Identify and label them just as you did with your regular collection.
8. Certain trees have characteristic fall leaf coloration. List at least 15 trees and tell what color each is in the fall.
9. Write an essay on a subject of interest to you, that might be used as a newspaper article or a talk. You might want to write about our state tree and how it was chosen, or about your favorite tree and why you selected it as your favorite.

## Suggested Visual Presentations

1. Identifying trees by leaf characteristiss
2. Collecting, pressing, and mounting tree leaves
3. Mal: ig leaf prints
4. Using a plant key in tree identification
5. Making a display box for exhibiting fruits.

## Your Leat Collection

When you go out to collect leaves it is a good idea to take a newspaper or a large magazine along. Put the leaves between the pages of the paper to keep them from drying out too fast and protect them from being torn or broken. Be sure to press the leaves as soon as you can. If you need help in identifying
some of the leaves, your club leader or school teacher will be glad to help, but before you ask for help try to find out yourself by using a botany book from the school library or perhaps a book at home. Remember there is a great satisfaction in doing a good job by yourself.

## Tips on Collecting Leaves

1. Do your collecting in mid-summer so you will get mature leaves.
2. Avoid fruit or orchard trees - you are mainly interested in forest trees.
3. Select good leaves. Avoid insect-eaten or torn leaves.
4. Most Important: Make sure you have the whole leaf and not just a leaflet when collecting specimens from trees such as walnut, honeylocust, or others that have compound leaves.
5. When collecting leaves, carry a newspaper with you and slip the leaves you collect between the pages. Be sure they are flat. This will prevent the leaves from curling and becoming difficult to press.

## Instructions for Pressing Leaves

1. Press and dry your leaves by laying them flat between sheets of newspapers or some other kind of porous paper.
2. Use heavy weights such as bricks so your leaves will be prosied flat. Don't try to press too many leaves at one time
and be sure to change the papers every two days.
3. Use plenty of dry newspapers. If the papers are not changed frequently your leaves may mildew.

## Constructing a Fruit Display Box

Since tree fruits are very irregular in size and do not lend themselves to simple mounting techniques, it is desirable to construct a display box in which all of them may be kept. A container can easily be made from a shoe box, or a box of similar size, $\mathrm{c} t$ to a height of about 2 inches. It may be covered with celloph, ne or a similar material. Fill the box with cotton and arrange the fruits neatly in it. Any number of fruits may be put
in the box as long as they are arranged neatly and are not too crowded. Place name tags near each specimen for its identification. The appearance of your box may be greatly improved by covering it with cloth, wallpaper, or a similar attractive material. Its strength may be increased by reinforcing the corners with tape.
